

DM7490A, DM7493A Decade and Binary Counters

General Description

Each of these monolithic counters contains four master-slave flip-flops and additional gating to provide a divide-by-two counter and a three-stage binary counter for which the count cycle length is divide-by-five for the 90A and divide-by-eight for the 93A.

All of these counters have a gated zero reset and the 90A also has gated set-to-nine inputs for use in BCD nine's complement applications.

To use their maximum count length (decade or four-bit binary), the B input is connected to the ${\sf Q}_{\sf A}$ output. The input count pulses are applied to input A and the outputs are as

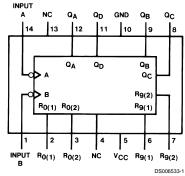

described in the appropriate truth table. A symmetrical divide-by-ten count can be obtained from the 90A counters by connecting the \mathbf{Q}_{D} output to the A input and applying the input count to the B input which gives a divide-by-ten square wave at output $\mathbf{Q}_{A}.$

Features

- Typical power dissipation
 - 90A 145 mW
 - 93A 130 mW
- Count frequency 42 MHz

T _A	Free Air Operating Te	mperature	-55		125	0		70	°C

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

'90A Electrical Characteristics

over recommended operating free air temperature range (unless otherwise noted)

Symbol	Parameter	Conditions		Min	Typ (Note 2)	Max	Units
V _I	Input Clamp Voltage	V _{CC} = Min, I _I = -12 mA				-1.5	V
V _{OH}	High Level Output	V _{CC} = Min, I _{OH} = Max		2.4	3.4		V
	Voltage	$V_{IL} = Max, V_{IH} = Min$					
V _{OL}	Low Level Output	V _{CC} = Min, I _{OL} = Max			0.2	0.4	V
	Voltage	V _{IH} = Min, V _{IL} = Max (No	ote 5)				
I _I	Input Current @ Max	$V_{CC} = Max, V_I = 5.5V$				1	mA
	Input Voltage						
I _{IH}	High Level Input	V _{CC} = Max	A			80	
	Current	V _I = 2.7V	Reset			40	μA
			В			120	
I _{IL}	Low Level Input	V _{CC} = Max	Α			-3.2	
	Current	$V_1 = 0.4V$	Reset			-1.6	mA
			В			-4.8	
I _{os}	Short Circuit	V _{CC} = Max	DM54	-20		-57	mA
	Output Current	(Note 3)	DM74	-18		-57	
I _{cc}	Supply Current	V _{CC} = Max (Note 4)			29	42	mA

Note 2: All typicals are at V_{CC} = 5V, T_A = 25°C.

 $\textbf{Note 3:} \ \ \text{Not more than one output should be shorted at a time.}$

Note 4: I_{CC} is measured with all outputs open, both RO inputs grounded following momentary connection to 4.5V, and all other inputs grounded.

Note 5: Q_A outputs are tested at I_{OL} = Max plus the limit value of I_{IL} for the B input. This permits driving the B input while maintaining full fan-out capability.

Note 6: $T_A = 25^{\circ}C$ and $V_{CC} = 5V$.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DE-VICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMI-CONDUCTOR CORPORATION. As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- 2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
